Scikit_Assignment 01_Solution

July 3, 2020

1 Assignment 01: Evaluate the Ad Budget Dataset of XYZ Firm

The comments/sections provided are your cues to perform the assignment. You don't need to limit yourself to the number of rows/cells provided. You can add additional rows in each section to add more lines of code.

If at any point in time you need help on solving this assignment, view our demo video to understand the different steps of the code.

Happy coding!

1: Import the dataset

[7]:
```
#Import the required libraries
import pandas as pd
```

[2]:
```
#Import the advertising dataset
df_adv_dataset = pd.read_csv("Advertising Budget and Sales.csv", index_col=0)
```

2: Analyze the dataset

[3]:
```
#View the initial few records of the dataset
df_adv_dataset.head()
```

[3]:

	TV Ad Budget ($)	Radio Ad Budget ($)	Newspaper Ad Budget ($)	Sales ($)
1	230.1	37.8	69.2	22.1
2	44.5	39.3	45.1	10.4
3	17.2	45.9	69.3	9.3
4	151.5	41.3	58.5	18.5
5	180.8	10.8	58.4	12.9

[9]:
```
#Check the total number of elements in the dataset
df_adv_dataset.size
df_adv_dataset.shape
```

[9]: 800

3: Find the features or media channels used by the firm

[10]:
```
#Check the number of observations (rows) and attributes (columns) in the dataset
df_adv_dataset.columns
```

[10]:
```
Index(['TV Ad Budget ($)', 'Radio Ad Budget ($)', 'Newspaper Ad Budget ($)',
       'Sales ($)'],
      dtype='object')
```

[13]:
```
#View the names of each of the attributes
df_adv_dataset[["Newspaper Ad Budget ($)","Radio Ad Budget ($)","TV Ad Budget␣
↪($)"]]
```

[13]:

	Newspaper Ad Budget ($)	Radio Ad Budget ($)	TV Ad Budget ($)
1	69.2	37.8	230.1
2	45.1	39.3	44.5
3	69.3	45.9	17.2
4	58.5	41.3	151.5
5	58.4	10.8	180.8
..	…	…	…
196	13.8	3.7	38.2
197	8.1	4.9	94.2
198	6.4	9.3	177.0
199	66.2	42.0	283.6
200	8.7	8.6	232.1

[200 rows x 3 columns]

4: Create objects to train and test the model; find the sales figures for each channel

[27]:
```
#Create a feature object from the columns
X_feature = df_adv_dataset[["Newspaper Ad Budget ($)","Radio Ad Budget ($)","TV␣
↪Ad Budget ($)"]]
```

[28]:
```
#View the feature object
X_feature.head()
```

[28]:

	Newspaper Ad Budget ($)	Radio Ad Budget ($)	TV Ad Budget ($)
1	69.2	37.8	230.1
2	45.1	39.3	44.5
3	69.3	45.9	17.2
4	58.5	41.3	151.5
5	58.4	10.8	180.8

[16]:
```
#Create a target object (Hint: use the sales column as it is the response of␣
↪the dataset)
Y_target = df_adv_dataset[['Sales ($)']]
```

[17]:
```
#View the target object
Y_target.head()
```

[17]:

	Sales ($)
1	22.1
2	10.4
3	9.3
4	18.5
5	12.9

[29]:
```
#Verify if all the observations have been captured in the feature object
X_feature.shape
```

[29]: (200, 3)

[20]:
```
#Verify if all the observations have been captured in the target object
Y_target.shape
```

[20]: (200, 1)

5: Split the original dataset into training and testing datasets for the model

[30]:
```
#Split the dataset (by default, 75% is the training data and 25% is the testing␣
↪data)
from sklearn.model_selection import train_test_split
x_train, x_test, y_train, y_test = train_test_split(X_feature, Y_target,␣
↪random_state = 1)
```

[31]:
```
#Verify if the training and testing datasets are split correctly (Hint: use the␣
↪shape() method)
print(x_train.shape)
print(x_test.shape)
print(y_train.shape)
print(y_test.shape)
```

```
(150, 3)
(50, 3)
(150, 1)
(50, 1)
```

6: Create a model to predict the sales outcome

[38]:
```
#Create a linear regression model
from sklearn.linear_model import LinearRegression
linreg = LinearRegression()
linreg.fit(x_train,y_train)
```

[38]:
```
LinearRegression(copy_X=True, fit_intercept=True, n_jobs=None, normalize=False)
```

[39]:
```
#Print the intercept and coefficients
print(linreg.intercept_)
print(linreg.coef_)
```

```
[2.87696662]
[[0.00345046 0.17915812 0.04656457]]
```

[40]:
```
#Predict the outcome for the testing dataset
y_predict = linreg.predict(x_test)
y_predict
```

[40]:
```
array([[21.70910292],
       [16.41055243],
       [ 7.60955058],

[19.60636679]])
```

7: Calculate the Mean Square Error (MSE)

[47]:
```
#Import required libraries for calculating MSE (mean square error)
from sklearn import metrics
import numpy as np
```

[49]:
```
#Calculate the MSE
print(np.sqrt(metrics.mean_squared_error(y_test,y_predict)))
```

```
1.404651423032897
```
